(54) Title: RECONFIGURABLE SWITCH

(57) Abstract: To simplify the reconfiguration of switches in a building automation switch panel, touch switches (27) of the mechanical, capacitive or charge transfer type are configured so that the electrode pattern (25) on the switch body can be activated using switch positions on a cover plate (27). The electrode pattern on the reverse face of the cover plate are selected so that a set of cover plates in combination with a single switch body provides as many switch positions as the body can provide. This makes reconfiguring, a matter of changing the front cover plate of the switch and using a software program to reconfigure the electronics if necessary.
